

Cities of Tomorrow and Their Energy Supply

Self-Powered Smart Infrastructure

An aerial photograph of a city at dusk, featuring a prominent tower with a circular observation deck and a yellow top. The city is illuminated with lights, and mountains are visible in the background. The image is overlaid with a blue geometric design in the top left corner.

**Gear Up A New
Industrial Revolution**

...we know what we are, but know not what we may be.

Hamlet: Act 4 Scene 5

William Shakespeare

Challenges for Us

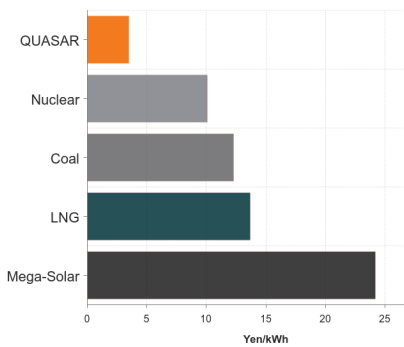

More Energy, Less Carbon

Our society is growing like never before. Growth demands an increasing supply of energy, but at the time reducing carbon emission is a necessary, no longer an option. Smart city is our prospect to improve quality of life, but local comfort may come at the cost of accelerating global warming. We only have limited time to address that challenge.

Affordable Smart City

A true solution shall be economically affordable and ecologically friendly. A smart city needs a set of smart infrastructure built at first, while all current options are highly expensive. It might be possible to burn a lot of money to build one smart city, but a scalable and attractive smart city plan would indeed call for a more economical way. We provide a breakthrough technology which enables all exterior surfaces of buidlings to generate electricity using ambient photons.

Features

Economical

A solution is not scalable until it is truly inexpensive. Quantum optics enables our incredibly low cost of 3.5 Yen/kWh, charge less money than any known electricity generation method.

Reliable

Market solar cells do not provide effective output during cloudy and rainy days. Our light concentration technology can direct and modulate photons, and the outgoing beam is always much stronger than the ambient light, achieving predictable all-weather output.

Intelligent

Our panel is inherently multi-functional. It “photovoltaicify” all exterior surfaces of buildings. Customizable sensors and signal-senders are embedding in the panel and powered by stable output from the panel itself. Buildings tomorrow will behave like your smart phone today.

Internet of Everything

From self-powered smart infrastructure to industry-level applications, and innovations based on them, we provide an integrated way to digitalize your daily life. Energy, which precedes the collection and computation of information, is now becoming distributedly available. As photons are everywhere, energy supply would be unprecedently accessible and inexpensive. That omnipresence would enable us to connect everything. And edge Computing or cloud computing at your choice, no worry about the privacy.

Network

Panels of a building are inherently connected with each other, acts as a neural network.

Sensors

Customizable sensors providing with the information required. Make your building smart.

Robots

Embedded signal senders to direct robots according to data collected.

Harbinger of A Brand New Era

The future is now

As a pioneer and the unique leader in wave vector reconstruction technology, Quasar has revolutionized energy generation by enabling intense light glowing solely by modulating photons – so stable electricity output from solar power during heavily overcast days.

Synthesizing with the construction of smart cities, we will advance potential energy supply to a new level, with much less carbon emission. And this is the future we are going to create together.

The most inexpensive electricity generation method in the world.

Stable output, respond to industry-level electricity consumption plan.

Truly ecological. Zero carbon emission during operations.

Imagination unlimited. Exterior surfaces for all man-made structures.

Our Mission

Change the primary way of energy generation from fossil and nuclear energy to renewable resources in a schedulable and environment-friendly way.

Integrate the process of energy generation within smart infrastructures and lifestyles in everyone's social environment.
